        "depends_on": null,
        "help": "Select the way the application is built.\n\nBy default, the application is built as a binary file in a format compatible with the ESP-IDF bootloader. In addition to this application, 2nd stage bootloader is also built. Application and bootloader binaries can be written into flash and loaded/executed from there.\n\nAnother option, useful for only very small and limited applications, is to only link the .elf file of the application, such that it can be loaded directly into RAM over JTAG or UART. Note that since IRAM and DRAM sizes are very limited, it is not possible to build any complex application this way. However for some kinds of testing and debugging, this option may provide faster iterations, since the application does not need to be written into flash.\n\nNote: when APP_BUILD_TYPE_RAM is selected and loaded with JTAG, ESP-IDF does not contain all the startup code required to initialize the CPUs and ROM memory (data/bss). Therefore it is necessary to execute a bit of ROM code prior to executing the application.\n\nA gdbinit file may look as follows (for ESP32):\n\n# Connect to a running instance of OpenOCD\n  target remote :3333\n  # Reset and halt the target\n  mon reset halt\n  # Run to a specific point in ROM code, where most of initialization is complete.\n  t hb *0x40007d54\n  c\n  # Load the application into RAM\n  load\n  # Run till app_main\n  tb app_main\n  c\n\nExecute this gdbinit file as follows:\n  xtensa-esp32-elf-gdb build/app-name.elf -x gdbinit\n\nExample gdbinit files for other targets can be found in tools/test_apps/system/gdb_loadable_elf/\n\nWhen loading the BIN with UART, the ROM will jump to ram and run the app after finishing the ROM startup code, so there's no additional startup initialization required. You can use the 'load-ram' in esptool to load the generated .bin file into ram and execute.\n\nExample:\n  esptool --chip {chip} -p {port} -b {baud} --no-stub load-ram {app.bin}\n\nRecommended sdkconfig.defaults for building loadable ELF files is as follows.\nCONFIG_APP_BUILD_TYPE_RAM is required, other options help reduce application memory footprint.\n\n  CONFIG_APP_BUILD_TYPE_RAM=y\n  CONFIG_

    "help": "Optimize the application binary so that \"idf.py flash\" can flash only the data sectors that changed. Fast reflashing works without this option, enabling it improves reflash effectiveness by reducing the amount of data written on each reflash. Enabling this option classifies component libraries into two categories: mutable and immutable. Mutable libraries are expected to change frequently during development, while immutable libraries are considered stable. All project component libraries are treated as mutable; all other libraries are treated as immutable. In the generated linker script, input sections from immutable libraries are placed before those from mutable libraries. This layout helps localize changes in the output sections of the ELF file, so that recompilation primarily affects a confined area associated with the mutable libraries. To support this, some compiler optimizations, such as constant merging, are disabled, which helps minimize differences in the binary image between builds. However, this may increase the overall image size and flash usage. Additionally, this option inserts a padding, defined by the APP_BUILD_MINIMIZE_BINARY_CHANGES_PADDING option, after the input sections of mutable libraries. This allows further isolation of changes but also increases the size of the binary image and flash consumption. This option is primarily intended for development. It increases binary size and disables optimizations; it is not recommended for production builds.",

                "help": "Enables binary logging with host-side format string expansion.
In this mode, the\nformat argument of ESP_LOGx, ESP_EARLY_LOG, and ESP_DRAM_LOG macros is stored in a\nNOLOAD se
ction, not included in the final binary file. This reduces flash usage by\napproximately 10% - 35%. The esp_log(
) function uses the binary log handler to output\nmessages. Instead of sending the full log string, the chip tra
nsmits only the\naddresses of these strings (if present in the ELF file). If the format string\ncannot be found
in the ELF file, the chip sends the entire string. The host-side\nmonitor tool, which has access to the ELF file
, reconstructs the log message using\nthe format string.\nThis reduces firmware size by eliminating format strin
gs from\nflash memory and removing the usage of printf-like functions, potentially freeing up\na few kilobytes o
f space. To further reduce firmware size, wrap string data with ESP_LOG_ATTR_STR.",

        "help": "This config option helps decide whether flash is Quad or Octal, but please note some li
mitations:\n\n1. If the flash chip is an Octal one, even if one of \"QIO\", \"QOUT\", \"DIO\", \"DOUT\" options
is\n  selected in `ESPT00LPY_FLASHMODE`, our code will automatically change the\n  mode to \"OPI\" and the sam
ple mode will be STR.\n2. If the flash chip is a Quad one, even if \"OPI\" is selected in `ESPT00LPY_FLASHMODE`,
our code will\n  automatically change the mode to \"DIO\".\n3. This option is mainly to improve the out-of-box
experience of developers. It doesn't guarantee\n  the feature-complete. Some code still rely on `ESPT00LPY_OCT
_FLASH`. Please do not rely on this option\n  when you are pretty sure that you are using Octal flash.\n  In t
his case, please enable `ESPT00LPY_OCT_FLASH` option, then you can choose `DTR` sample mode\n  in `ESPT00LPY_FL
ASH_SAMPLE_MODE`. Otherwise, only `STR` mode is available.\n4. Enabling this feature reduces available internal
RAM size (around 900 bytes).\n  If your IRAM space is insufficient and you're aware of your flash type,\n  dis
able this option and select corresponding flash type options.",

    "help": "BLE Sleep Clock Accuracy(SCA) for the local device is used to estimate window widening in BLE connection events. With a lower level of clock accuracy(e.g. 500ppm over 250ppm), the slave needs a larger RX window to synchronize with master in each anchor point, thus resulting in an increase of power consumption but a higher level of robustness in keeping connected. According to the requirements of Bluetooth Core specification 4.2, the worst-case accuracy of Classic Bluetooth Low Power Oscillator (LPO) is +/-250ppm in STANDBY and in low power modes such as sniff. For BLE the worst-case SCA is +/-500ppm. 151ppm to 250ppm option is the default value for Bluetooth Dual mode. 251ppm to 500ppm option can be used in BLE only mode when using external 32kHz crystal as low power clock. This option is provided in case that BLE sleep clock has a lower level of accuracy, or other error sources contribute to the inaccurate timing during sleep.",

        "help": "When the chip exits sleep, the CPU and the flash chip are powered on at
the same time.
CPU will run rom code (deepsleep) or ram code (lightsleep) first, and then load or execute
code from flash.
Some flash chips need sufficient time to pass between power on and first read operation.
By default, without any extra delay, this time is approximately 900us, although some flash chip
types need more than that.
(!!! Please adjust this value according to the Data Sheet of SPI Flash used in your project.)
In Flash Data Sheet, the parameters that define the Flash ready timing after power-up (minimum
time from Vcc(min) to CS active) are usually named tVSL in ELECTRICAL CHARACTERISTICS chapter,
and the configuration value here should be:
ESP_SLEEP_WAIT_FLASH_READY_EXTRA_DELAY = tVSL - 900
For esp32 and esp32s3, the default extra delay is set to 2000us. When optimizing startup time
for applications which require it, this value may be reduced.
If you are seeing "flash read err, 1000" message printed to the console after deep sleep reset
on esp32, or triggered RTC_WDT/LP_WDT after lightsleep wakeup, try increasing this value.
(For esp32, the delay will be executed in both deep sleep and light sleep wake up flow.
For chips after esp32, the delay will be executed only in light sleep flow, the delay
controlled by the EFUSE_FLASH_TPUW in ROM will be executed in deepsleep wake up flow.)",

"help": "This setting defines which hardware timers are used to\nimplement 'gettimeofday
' and 'time' functions in C library.\n\n- If both high-resolution (systemtimer for all targets except ESP32)\n- a
nd RTC timers are used, timekeeping will continue in deep sleep.\n- Time will be reported at 1 microsecond res
olution.\n- This is the default, and the recommended option.\n- If only high-resolution timer (systemtimer) is us
ed, gettimeofday will\n- provide time at microsecond resolution.\n- Time will not be preserved when going in
to deep sleep mode.\n- If only RTC timer is used, timekeeping will continue in\n- deep sleep, but time will be
measured at 6.(6) microsecond\n- resolution. Also the gettimeofday function itself may take\n- longer to ru
n.\n- If no timers are used, gettimeofday and time functions\n- return -1 and set errno to ENOSYS; they are de
fined as weak,\n- so they could be overridden.\n- If you want to customize gettimeofday() and other time fun
ctions,\n- please choose this option and refer to the 'time.c' source file\n- for the exact prototypes of th
ese functions.\n\n- When RTC is used for timekeeping, two RTC_STORE registers are\n- used to keep time in deep
sleep mode.",

    }

```

ll related peripherals will not be available during sleep, including wake-up sources from the peripherals (For detailed availability information, see the note of the corresponding wakeup source enable function). The chip will automatically save/restore register context during sleep/wakeup to make the upper layer user unaware of the peripheral powerdown during sleep. Enabling this option will increase static RAM and heap usage but will also significantly reduce power consumption during lightsleep, the actual memory cost depends on the peripherals you have initialized, for specific power consumption data in this mode, please refer to Electrical Characteristics section in the chip datasheet. (In order to save/restore the context of the necessary hardware for FreeRTOS to run, it will need at least 4.55 KB free heap at sleep time. Otherwise sleep will not power down the peripherals.)

Note1: Please use this option with caution, the current IDF does not support the retention of all peripherals. When the digital peripherals are powered off and a sleep and wake-up is completed, the peripherals that have not saved the running context are equivalent to performing a reset. Please confirm the peripherals used in your application and their sleep retention support status before enabling this option, peripherals sleep retention driver support status is tracked in `power_management.rst`.

Note2: When this option is enabled simultaneously with `FREERTOS_USE_TICKLESS_IDLE`, since the UART will be powered down, the UART FIFO will be flushed before sleep to avoid data loss, however, this has the potential to block the sleep process and cause the wakeup time to be skipped, which will cause the tick of freertos to not be compensated correctly when returning from sleep and cause the system to crash. To avoid this, you can increase `FREERTOS_IDLE_TIME_BEFORE_SLEEP` threshold in `menuconfig`.

Note3: Enabling this option does not necessarily mean that the peripheral power domain will be returned down during sleep. The control priority of `esp_sleep_pd_config` is higher than this option, user code can still prevent the peripheral power domain from powering down during sleep by `esp_sleep_pd_config(ESP_PD_DOMAIN_TOP, ESP_PD_OPTION_ON)`. In addition, whether the peripheral power domain is powered down during sleep also depends on the sleep working strategy selected by the driver. If any module belonging to the peripheral power domain chooses not to be powered down during sleep, then the peripheral power domain will not be powered off either.",

egion at the upper end of PSRAM (highest\nphysical addresses) that is mapped WITHOUT encryption, even when flash
\nencryption is enabled. Memory allocated\nfrom this region (via MALLOC_CAP_SPIRAM_NO_ENC) is stored in plaintex
t in\nPSRAM and can be observed by an attacker with physical access to the PSRAM\ninterface.\n\nDO NOT enable th
is unless you have weighed the trade-off:\n - You accept that any data placed in this region is unprotected at
rest.\n - You will only allocate workloads that are not security-sensitive (e.g.\n video frame buffers, inte
rmediate codec scratch buffers) into this region.\n - You understand that PSRAM-resident TLS state, keys, or ot
her secrets\n MUST NOT be allocated with MALLOC_CAP_SPIRAM_NO_ENC.\n\nUse case: PSRAM encryption imposes alig
nment constraints on buffers that\ncross PSRAM. Some DMA engines (e.g. 2D-DMA) cannot satisfy these alignment\nr
equirements, so DMA into encrypted PSRAM fails. This option lets such\nworkloads place their buffers in an unenc
rypted PSRAM region while keeping\nthe rest of PSRAM (and flash) encrypted.",

    "help": "If enabled, the app startup code will burn the ECC_FORCE_CONST_TIME efuse bit to force the ECC peripheral to always perform constant time point multiplication operations, irrespective of the ECC_MULT_SECURITY_MODE status bit that is present in the ECC_MULT_CONF_REG register. By default, ESP-IDF configures the ECC peripheral to perform constant time point multiplication operations, so enabling this config would provide security enhancement only in the cases when trusted boot is not enabled and the attacker tries carrying out non-constant time point multiplication operations by changing the default ESP-IDF configurations. Performing constant time operations protect the ECC multiplication operations from timing attacks. For targets that support Secure Boot using ECDSA-P384, the write-protection bit of the efuse bit could be shared by multiple other efuse bits and can be programmed by the application when Secure Boot is enabled. Thus, you could select CONFIG_SECURE_BOOT_SKIP_WRITE_PROTECTION_SCA, in case you would like to skip the write-protection of the efuse bit.",

documentation). However\nthe default length of a beacon frame can simultaneously hold only five root node identi
fier structures,\nmeaning that a root node conflict of up to five nodes can be detected at one time. In the occu
rrance of\nmore root nodes conflict involving more than five root nodes, the conflict resolution process will\nnd
etect five of the root nodes, resolve the conflict, and re-detect more root nodes. This process will\nrepeat unt
il all root node conflicts are resolved. However this process can generally take a very long\ntime.\n\nTo counte
r this situation, the beacon frame length can be increased such that more root nodes can be\ndetected simultaneo
usly. Each additional root node will require 36 bytes and should be added on top of\nthe default beacon frame le
ngth of\n752 bytes. For example, if you want to detect 10 root nodes simultaneously, you need to set the beacon\
nframe length as\n932 (752+36*5).\n\nSetting a longer beacon length also assists with debugging as the conflicti
ng root nodes can be\nidentified more quickly.",

root node identifier structures,\nmeaning that a root node conflict of up to five nodes can be detected at one t
ime. In the occurrence of\nmore root nodes conflict involving more than five root nodes, the conflict resolution
process will\ndetect five of the root nodes, resolve the conflict, and re-detect more root nodes. This process
will\nrepeat until all root node conflicts are resolved. However this process can generally take a very long\nti
me.\n\nTo counter this situation, the beacon frame length can be increased such that more root nodes can be\ndet
ected simultaneously. Each additional root node will require 36 bytes and should be added on top of\nthe default
beacon frame length of\n752 bytes. For example, if you want to detect 10 root nodes simultaneously, you need to
set the beacon\nframe length as\n932 (752+36*5).\n\nSetting a longer beacon length also assists with debugging
as the conflicting root nodes can be\nidentified more quickly.",

            "help": "FreeRTOS can check if a stack has overflowed its bounds by checking either the value of the stack\npointer or by checking the integrity of canary bytes. (See FREERTOS_CHECK_STACK_OVERFLOW for more\ninformation.) These checks only happen on a context switch, and the situation that caused the stack\noverflow may already be long gone by then. This option will use the last debug memory watchpoint to\nallow breaking into the debugger (or panic'ing) as soon as any of the last 32 bytes on the stack of a\ntask are overwritten. The side effect is that using gdb, you effectively have one hardware watchpoint\nless because the last one is overwritten as soon as a task switch happens.\n\nAnother consequence is that due to alignment requirements of the watchpoint, the usable stack size\ndecreases by up to 60 bytes. This is because the watchpoint region has to be aligned to its size and\nthe size for the stack watchpoint in IDF is 32 bytes.\n\nThis check only triggers if the stack overflow writes within 32 bytes near the end of the stack, rather\nthan overshooting further, so it is worth combining this approach with one of the other stack overflow\ncheck methods.\n\nWhen this watchpoint is hit, gdb will stop with a SIGTRAP message. When no JTAG OCD is attached,\nesp-idf will panic on an unhandled debug exception.",
